Analyte description	Pro-B-type natriuretic peptide (ProBNP) is released from cardiac myocytes, and is cleaved into BNP and its N-terminal fragment, NT-proBNP. Plasma concentrations of both BNP and NT-proBNP are significantly increased in patients with asymptomatic and symptomatic left ventricular dysfunction. There is excellent clinical and statistical correlation between assays for BNP and NT-proBNP. Due to the longer half-life in the circulation, NT-proBNP levels in blood plasma are generally 6-10 times higher than BNP. The better stability and wider dynamic range for NT-proBNP may provide an advantage in clinical testing.
Product concentration	0.5 mg/ml when reconstituted with 200 µl of deionized water
